

KASSTA Webinar

Korean-American AeroSpace Science and Technology Association

Wednesday, Oct 21st, 2026 (virtual)

4:00 PM (PT), 7:00 PM (ET)

[Register for the Webinar](#)

Speakers

Chae Kyung, Sim

Ph.D. in Astrophysics

Head, Center for Planetary Exploration
Korea Astronomy and Space Science Institute

KASI's Science Payloads for Lunar Landers

The Korea Astronomy and Space Science Institute (KASI) is developing four science payloads (2020–2027) for NASA's Commercial Lunar Payload Services (CLPS). This presentation highlights four representative payloads. LUSEM (CP-11, Intuitive Machines Nova-C) measures charged particles above ~50 keV, targeting Reiner Gamma Swirl with launch expected in the second half of 2026; its flight model was delivered in 2023. LVRAD (CT-4, IM Nova-D) characterizes the lunar surface radiation environment via dosimeters and neutron spectrometers, targeting a South Pole landing in 2030 or later. LSMAG, a fluxgate magnetometer with heritage from Danuri (KPLO)'s KMAG, is flight-ready and awaiting mission integration. GrainCams (SurfCam/LevCam) provide microscopic imaging of regolith grains and levitating dust, with flight model completion expected by end-2026. Together, these payloads establish an integrated observational basis for lunar surface radiation, magnetic field, and regolith environments.

It is planned to give gift cards to selected participants.
